

Rowperfect

technical & physical advantage

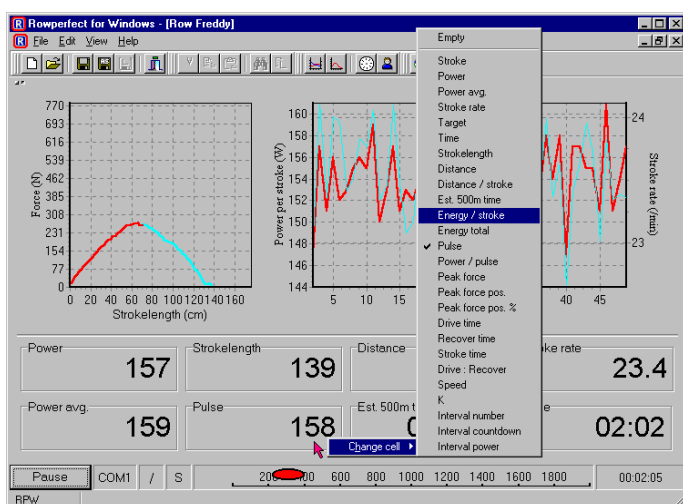

the Original rowing simulator

www.rowperfect.com.au

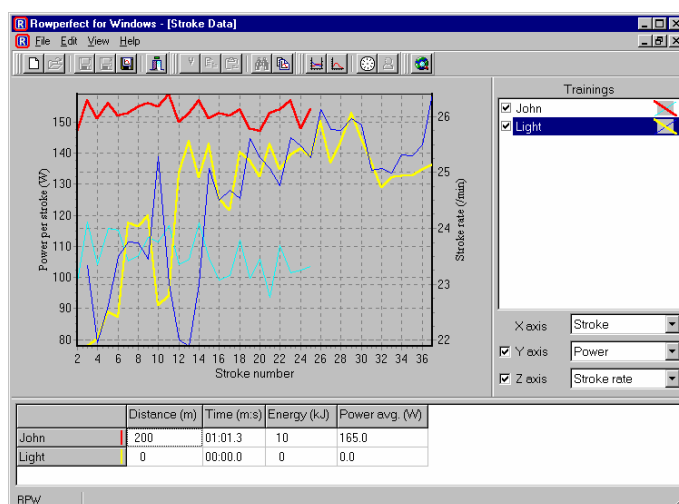

Rowperfect for Windows (or *RPW* for short) is the new Windows based version of the Rowperfect software. It runs on all MS Windows versions currently available, including - but not limited to - Windows 98, ME and XP and is compatible with most Serial to USB converters.

Besides all the features and options the DOS software already has, *RPW* comes standard with an abundance of extras:

- Over 10 *extra* values are calculated for each stroke, such as Drive / Recovery ratio and Peak force position
- 2 training sessions can be opened at the same time, to compare stroke data charts
- Recording time is now only limited by available computer memory (RAM)
- All the charts have a zoom-and-pan possibility
- Training sessions can be extended with extra information, such as Type, Event and a Note
- The force curves window has 4 different automatically calculated average force curves
- The program has a Windows-like, intuitive user interface
- ... and much more!
